FOREWORD

This annual summary of Illinois Agricultural Statistics presents a summary of the various reports prepared and published by the Illinois Cooperative Crop Reporting Service plus selected other data series of general interest. Data for the years 1975-79 and 1980, when available, are presented for most items.

Official State estimates are included in this summary for all data items. In addition, crop reporting district and county estimates are included for major crop and livestock items.

Some of the estimates presented in this publication were prepared from State financed surveys. Funds and personnel in the Illinois and United States Departments of Agriculture are pooled in the Cooperative Crop Reporting Service in order to better serve the needs of those interested in agricultural statistics.

The Crop Reporting Service wishes to express its appreciation to the many thousands of farmers and business firms who contribute every year to provide the basis of our estimates. Only the faithful service of the corps of reporters and other cooperators makes these estimates possible.

James R. Kendall

GENERAL ILLINOIS INFORMATION

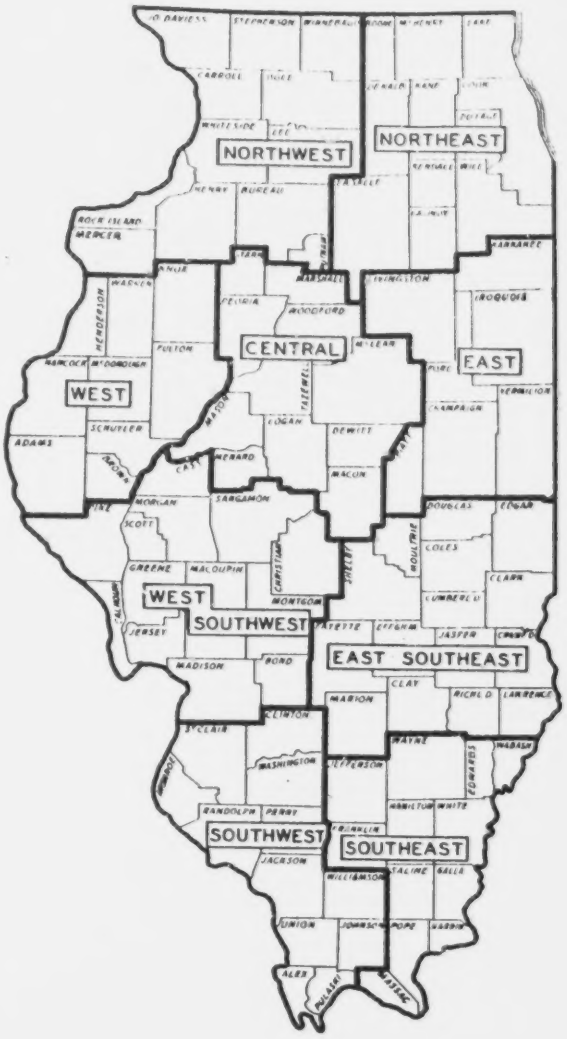
This first section of the Annual Summary presents a long time history of changes in Illinois' total population, farm population, number of farms and land in farms. In addition, general information about the climate of Illinois is included. The map and explanation below of Crop Reporting Districts is also presented to aid in understanding the detailed data in this report.

CROP REPORTING DISTRICTS

For statistical purposes the counties of Illinois are grouped into nine Crop Reporting Districts (shown on the map at right). These groupings represent divisions of approximately equal size with similar soils, growing conditions and types of farming.

Crop Reporting Districts are used in the compilation of most reports. It is not possible to collect sufficient data for each county to make county estimates on a timely basis. It is possible to summarize data at a district level and weight districts together by production percentages to arrive at the best State estimates.

Many data series in this bulletin present estimates for Crop Reporting Districts. Some series are further broken down into county estimates within districts.



POPULATION: Total and farm population, Illinois and United States, selected years

Year	United States			Illinois

CLIMATE OF ILLINOIS

Illinois lies midway between the Continental Divide and the Atlantic Ocean and some 500 miles north of the Gulf of Mexico. The climate is typically continental with cold winters, warm summers, and frequent short period fluctuations of temperature, humidity, cloudiness and wind direction. The excellent soil and well distributed annual precipitation of 32 to 48 inches favor a very high standard of agricultural production.

Storm systems move through the State most frequently during the winter and spring months, and cause a maximum of cloudiness during these seasons. Sunshine averages more than 70% of possible during the three summer months, and precipitation occurs mostly during short duration showers or thunderstorms.

Illinois extends nearly 400 miles from north to south and winter temperatures show a contrast of approximately 14°F in mean temperature. Temperatures reach zero or below on an average of seven days annually in the extreme north and only one or less in the far south. The lowest temperature of record is -35°F at Mt. Carroll on January 22, 1930.

The north-south mean temperature range in July is only about 6°F as both sunshine and temperature are more uniform. Temperatures reach 90°F or higher on an average of near 20 days annually in the north and about 50 days in the south and west-central. The highest temperature of record is 117°F at East St. Louis on July 14, 1954.

Latitude is the major factor in both temperature and precipitation with the northern counties averaging cooler and drier than the south. Distance from the Gulf of Mexico and lower air mass temperatures both tend to reduce precipitation in the north. Annual precipitation is approximately 1½ times as great in the extreme south as in the extreme north, but most of the excess in the south falls during winter and early spring. Average total precipitation for December through March in the extreme southeast is about twice that in the extreme northwest. Precipitation during the warm season is more uniform and the annual average for April through September ranges from 21 to 24 inches throughout the State.

Precipitation during fall, winter, and spring tends to fall uniformly over large areas. In contrast, summer precipitation occurs principally as brief showers or thunderstorms, affecting relatively small areas. This erratic occurrence of summer showers generally results in an uneven distribution.

The annual average snowfall ranges from near 30 inches in the extreme north to only 10 inches in the extreme south. The most likely form of winter precipitation in the north is snow. More than 90% of Cairo's winter precipitation falls as rain. Snowfalls of 1 inch or more occur on an average of 10 to 12 days per year in the extreme north and decrease to 3 or 4 in the far south. Snow cover of an inch or more averages about 50 days annually in the north and only about 15 in the south.

Thunderstorms average about 35 to 50 annually, but most are quite harmless. On occasion they provide the source for hail, damaging winds, and tornadoes. Hail falls on an average of two or three days annually in the same locality, but only about once every two years during periods when crops are most susceptible to damage. Not all hailstorms have stones of sufficient size or quantity to cause major crop damage.

The mean freeze-free period ranges from less than 155 days in the extreme north to more than 210 days in the extreme south. The mean date of the last spring freeze ranges from April 5 in the extreme south, to May 5 in the extreme north. The mean date of the first fall freeze ranges from October 5 in the extreme northwest to October 25 in the extreme south. Most crop damaging freezes are radiational, that is, they occur under conditions of clear skies and light winds rather than through cold air invasion of the area.

#First fall freeze averages approximately 10 days later in Cook Co. near Lake Michigan.

Dates given are average for the district. Locations within the district having similar exposure usually agree within plus or minus five days. Crop damaging freezes are most often associated with radiation freezes. Under such conditions, clear skies and light winds, the temperature may vary 10°F or more at adjacent ridge and valley locations. Tables are based on temperatures in a standard Weather Service thermometer shelter at an approximate height of five feet above ground. Under best radiational conditions the temperature will be lower at ground level.

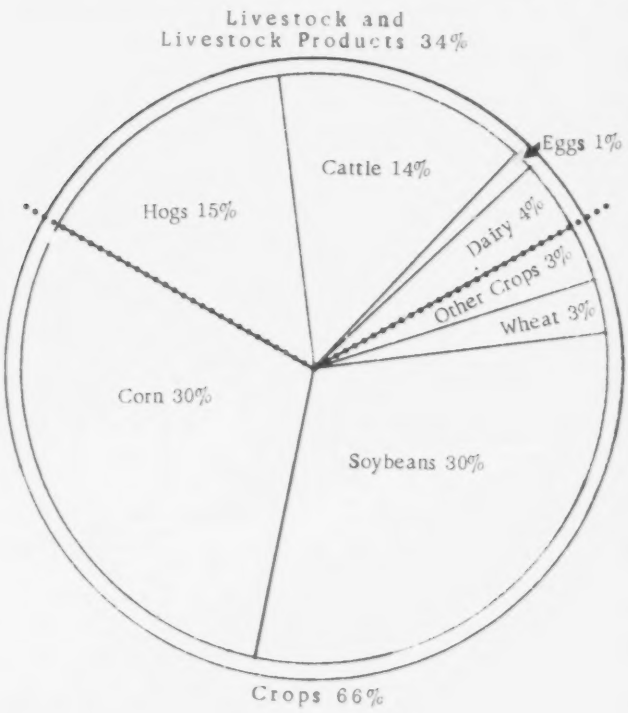
FARM INCOME

ILLINOIS CASH FARM INCOME BY COMMODITIES 1979



TOTAL CASH RECEIPTS INCREASE 6 PERCENT

Corn and soybeans provided the two largest sources of cash receipts to farmers in 1979. Corn sales accounted for 30% of the total cash receipts, up from 28% of the total in 1978. Soybeans also accounted for 30% of the total cash receipts in 1979, down from 35% in 1978.

Cash receipts by Illinois farmers for all commodities totaled 6.96 billion dollars, up 6% from 1978. Receipts from crops were up 4% from 1978, primarily due to a 16% increase in corn cash receipts. Livestock receipts increased 11% from last year, totaling 2.4 billion dollars. Increases were noted in all livestock categories except hogs, which showed a 4% decrease from 1978. Cash receipts for crops accounted for 66% of the total cash receipts in 1979, compared with 67% in the two previous years.

TOTAL NET FARM INCOME UP 35% IN 1979

Total net farm income of Illinois farmers in 1979 increased 35% over last year and 36% over the 1977 level. The total net income per farm was $17,202 compared to $12,489 in 1978 and $12,192 in 1977.

However, the 1979 realized net farm income (amount left after deducting farm production expenses from realized gross farm income) was down 34% from 1978, but 2% above the level in 1977. Even though farm production expenses were up over 1978, net farm income was still higher due to increases in all types of farm incomes, except for government payments.

FIELD AND SEED CROPS

1979 CROP PRODUCTION INDEX UP 17 PERCENT

Illinois' 1979 all-crop production index, at a record high 211% of its 1957-59 base, is up 17% from 1978 and up 12% from 1977. Higher production levels for all major crops, plus many minor crops, contributed to this substantial increase over 1978. Illinois farmers harvested 23,442,000 acres of crops in 1979, compared with 22,709,-000 acres in 1978 and 23,441,000 acres in 1977.

CROP DEVELOPMENT and WEATHER 1979

1979 CROP DEVELOPMENT

Weather in 1979 was generally cool and wet, bringing about slower than normal development of most crops. Small grain development was ahead of 1978 but behind normal due to the cool, wet spring. Fieldwork during April and the first part of May was hindered by spring rains but after that, weather conditions improved. A dry period occurred from mid-June to mid-July.

The 1979 winter wheat crop was planted at a normal pace and came through the 1979 winter in good condition. Some low-lying wheat fields were hurt by flooding and some others by ice and water pooling. The wet, cool spring delayed fertilizer application and crop development. Wheat generally progressed ahead of 1978 but behind average. Harvest conditions were good and was complete by mid-July.

Corn planting began late in 1979 but finished ahead of the average pace due to favorable weather in mid-May. Adequate moisture from a wet spring allowed corn to develop with little moisture stress during a dry period extending from mid-June to mid-July. Although the crop matured slower than usual due to cooler than normal weather, harvest losses and disease problems were minimal due to excellent harvest conditions. The 1979 corn crop set new records for both yield and production due to the extremely favorable growing and harvest conditions.

Soybean planting was delayed due to setbacks in corn planting due to the wet spring but was ahead of schedule by the first of June and complete around mid-June. Crop development was near normal during the year and harvest began at mid-September and was virtually complete by early November. The 1979 soybean crop also set new records for both yield and production as did the corn.

Oats seeding began the first part of April and progressed behind normal due to frequent spring rains, but was generally planted on a satisfactory schedule and was completed by mid-May. Crop development was ahead of 1978 but a little behind normal. Harvest progressed about the same as 1978, but slower than normal and was completed by mid-August. Although oats acreage was down from 1978, production was higher due to increased yields.

Weather conditions were good for hay growth during the season except for the early summer dry period, which reduced second cutting alfalfa yields. All other hay cuttings yielded well due to timely rains and mostly favorable harvest conditions. Although the acreage was down from the previous year, overall production was higher due to record yields.

Rye production increased 6% above 1978 levels as harvested acres increased and yields were the same. Barley production increased 31% above 1978 as yields increased and harvested acreage was unchanged. This reversed a three-year downward trend in barley production. Sorghum for grain production increased 10% as harvested acres were up and yield was unchanged from 1978.

Seeding of the 1980 winter wheat crop began around mid-September and was virtually complete by the first of November, slightly ahead of normal. The seedings were made under mostly good conditions although soil moisture was short in the northern part of the State. Some acreage showed limited growth, especially later plantings, due to drier conditions but overall the crop was in mostly good condition through the end of the year. Plowing for 1980 corn and soybean acreage progressed ahead of normal and was 75% complete by the end of 1979.

1979 WEATHER

Illinois was cool and wet during 1979. The Statewide precipitation level was .96 inches above normal with an accumulation of 38.98 inches for the year. Temperatures averaged 2.6 degrees below normal providing an annual average temperature of 50.4 degrees. The West, Central, and West-Southwest Crop Reporting Districts were the only three that had below normal precipitation. All districts had below normal temperatures.

January was above normal in precipitation in every district, continuing an above normal trend which started in November 1978. February was slightly below normal in precipitation except in the South. March and April were both above normal in precipitation. Heavy rainfall during March added to flooding problems due primarily to snowmelt. May and June were below normal for most of the State. The dry period continued in the North during July. During July and August, heavy rainfall caused flooding problems in some areas of the South. September was very dry with most areas recording little or no rainfall. The dry period continued through October and ended in November when nearly every district was above normal. Precipitation continued above normal in the North during December, but was below normal in the South.

A cold period which started in December 1978 continued through February 1979 setting new minimum temperature records in scattered areas of the State. Both January and February were one of the coldest months in history. March was slightly above normal in temperature except in the North. Below normal temperatures returned to the State during April and May with freezing minimum temperatures common in April. June was slightly above normal in the North. A cool period returned to many areas during July and August with several new minimum records set in July. The cool period ended briefly during the third week of September but returned again during the last week and lasted until mid-November. In mid-October minimum temperatures dropped below freezing, ending the 1979 growing season. During the last week of November temperatures were above normal and this trend continued for most of December. A brief, cool period during the first week of December sent minimum temperatures below the zero degree mark.

Snowfall in January set new record amounts for the third straight year. A snowstorm in late February caused havoc by depositing as much as 24 inches of snow on Southern Illinois. The snowstorms ended in March with only small amounts reported. Due to the heavy snow and above normal precipitation amounts, most rivers and creeks went above flood stage during March and flooding was common. Light snow returned to the northern part of the State during the last week in November and the first week of December.

A total of 12 tornadoes was recorded during 1979 compared to 13 last year. August was the most active month with 6 recorded.

CROP DEVELOPMENT and VARIETY INFORMATION

Crop development information is collected and published each week during the crop preparation and growing season in the Weekly Weather - Crop Bulletin. In this section, planting and harvesting information for major crops is summarized along with selected information on crop maturity.

Also included in this section are data on leading varieties of soybeans and wheat; and planting and harvesting methods for corn.

FRUIT

1979 APPLE PRODUCTION

Illinois commercial utilized apple production totaled 110 million pounds (2,619,000 bushels, 42-lb. equivalents) in 1979, up 24% from 1978. Quality and size of the fruit were good to excellent throughout the State. No widespread losses were encountered from either weather conditions or pest-related problems. Golden Delicious was the leading variety, accounting for 33% of the total crop. Jonathan ranked second with 30%, and Red Delicious was third at 24%. Price per pound was estimated at 11.4 cents in 1979, compared with 12.8 cents per pound in 1978.

1979 PEACH PRODUCTION

Illinois peach production for 1979 was estimated at 15 million pounds (313,000 bushels, 48-lb. equivalents), 6% below the 1978 production of 16 million pounds. Severe winter weather damaged peach production for the third consecutive year. Weather damage ranged from very little to complete crop loss, dependent upon the local weather conditions. Value of the 1979 crop totaled $2,775,000 compared to $3,504,000 the previous year. Price per pound decreased from 1978's 21.9 cents to 18.5 cents per pound in 1979.

VEGETABLES

1979 PROCESSING SUMMARY

Total 1979 production of the principal processing vegetables (cabbage for kraut, cucumbers for pickles, lima beans, green peas, sweet corn, snap beans, tomatoes and beets) is estimated at 373,280 tons, up 6% from last year's 352,050 tons. The area harvested is estimated at 95,020 acres, slightly less than the 95,180 acres harvested in 1978. An increase in yield levels allowed production to increase as harvested acres were virtually unchanged. Value of the processing crop is estimated at $33.8 million, up 14% from $29.6 million in 1978. Estimates for carrots for processing, cucumbers for pickles, lima beans, green peas, tomatoes, and beets for processing are not published separately in order to avoid disclosing individual operation.

1979 FRESH MARKET SUMMARY

Total production of the principal fresh market vegetables (fresh and processed asparagus, fresh and processed carrots, fresh market cabbage, and sweet corn) in 1979 is estimated at 748,000 cwt., down 3% from last year's production of 775,000 cwt. Harvested area of 8,800 acres was estimated at 12% below the 1978 acreage level. Yield levels were generally higher than the past year but not enough to allow production to offset the reduction in acreage. Value of the crop was estimated at $6.8 million, compared to $6.9 million in 1978.

FLOWERS AND FOLIAGE PLANTS

TOTAL VALUE OF FLOWERS AND FOLIAGE PLANTS UP SLIGHTLY

Gross wholesale value of sales of selected flower types (cut and potted) and foliage plants in 1979 by Illinois commercial producers was $23.7 million, 3% more than the $22.9 million value of gross wholesale sales in 1978. The gross wholesale value for cut flowers was up on all surveyed types, except for chrysanthemums (standard and pompon), and snapdragons. Wholesale value for potted plants (including flowering and vegetable bedding plants) was up 6%, as all types, except poinsettias and geraniums, showed an increase over 1978. The wholesale price per unit for cut flowers in 1979 was lower than 1978 for all types with the exception of sweetheart roses and gladioli. Wholesale prices for potted plants were up from 1978 except for chrysanthemums and hydrangeas. Volumes sold for all cut flower types except snapdragons were higher in 1979 than the previous year. Volumes sold for most potted plants were also higher in 1979 than in 1978. Potted poinsettias and geraniums both had lower volumes of sales in 1979 compared with 1978. Flowering bedding plants were up in volume of sales compared with 1978 while vegetable bedding plants were slightly lower.

Net value of sales in 1979 of foliage plants for indoor or patio use was $3.1 million, down nearly 18% from 1978 when it was $3.8 million. The 1979 area in production was also lower at 612,000 square feet compared with 707,000 square feet in 1978, a decrease of 13%.

The Illinois Cooperative Crop Reporting Service began making official estimates in 1976 for the production of snapdragons, potted poinsettias, potted geraniums, potted lilies, potted hydrangeas, and flowering or vegetable bedding plants. Thus no production figures are available for these items prior to this time.

LIVESTOCK AND POULTRY

The total value of all cattle, hogs, sheep and chickens (excluding broilers) in Illinois at the beginning of 1980 was estimated at one billion 711.5 million dollars, an increase of around 2% from the beginning of 1979.

The number of cattle and calves in Illinois on January 1, 1980 was 2,700,000 head, 150,000 less than a year earlier. However, an increase in the average value per head to $475 from $385 a year earlier resulted in an increase in the value of the State's cattle herd to $1,282,500,000, a 17% increase over the January 1, 1979 inventory value of $1,097,250,000.

The hog and pig inventory increased 400,000 head -- to 6,950,000--from December 1, 1978 to December 1, 1979 but the sharp drop in average value per head from $84.50 to $58.00 resulted in a reduction in inventory value of 27%. The December 1, 1978 estimated value of all hogs was $553,475,000. It was down to $403,100 on December 1, 1979.

The number of sheep and lambs on January 1, 1980 was estimated at 190,000 head, 6,000 over the year earlier number. The value per head was estimated at $76.00, up $8.00 per head from a year earlier. This resulted in an estimated value of the sheep flock of $14,440,000, up 15% from the year earlier value of $12,512,000.

Chickens (excluding broilers) on December 1, 1979 were estimated at 6,950,000, down 9% from a year earlier. But a 20 cent increase in average value -- to $1.65--resulted in a 4% increase in the value of the flock, which on December 1, 1979 was estimated at $11,468,000.

For the livestock and poultry included in these estimates cattle accounted for about three-fourths of the total value at the beginning of 1980 compared with about 65% a year earlier.

PRICES

1979 Crop and Livestock Indexes

The Illinois Prices Received Index has been computed from 1956 to the present using new quantity weights each year. The Illinois Index relies on weights based on the average value and quantity of each commodity sold during a previous 5-year period.

The all farm products index of prices received by Illinois farmers in 1979 was 115% of the base period, 1973 through 1977, 5 points above the 1978 index. Prices received by farmers were fairly stable early in the year and peaked in July. A downward trend began in August but in December the index started to strengthen.

Crop prices were up considerably from 1978 but not as high as the 1975 to 1977 price levels. The crop index at 107 was up 8 points from the previous year. Prices strengthened the first half of the year and then decreased thru November. The prices received index for livestock at 130 was unchanged from last year. Livestock prices generally fluctuated downward until late in the year.

1/ Annual average is for December previous year through November current year.

PRICES PAID

Prices paid by farmers for major production items are collected from dealers and merchants at regularly recurring intervals by means of mailed inquiries and personal interviews. This information provides a historical series of prices paid for important production goods and services but perhaps more importantly provides cost data used in calculating the index of prices paid by farmers at the U.S. level. Also included in the index of prices paid are interest, taxes and wage rates. The index of prices received for all farm products sold, when divided by the index of prices paid gives a measure of what farm products will buy in terms of production needs such as fertilizer and machinery, and family living needs.

The table below shows average prices paid by Illinois farmers for selected feeds and motor supplies in 1977 thru 1979. Beginning in January 1977, the Bureau of Labor Statistics Consumer Price Index (CPI) was used to measure farmers' costs for family living items. Therefore, data on family living costs are no longer collected by the Department of Agriculture.

State or regional prices paid for feed, seed, fuels, and fertilizer, and U.S. prices for all commodities are published currently in AGRICULTURAL PRICES, a monthly report of the Economics, Statistics, and Cooperatives Service of the U.S.Department of Agriculture, Washington, D.C. Regional prices for building materials, farm machinery, farm supplies, and pesticides, and State prices for motor supplies are first published in the Annual Summary in June of the following year. These publications are available upon request to the United States Department of Agriculture, Economics, Statistics, and Cooperatives Service Washington, D.C. 20250.

PRICES PAID: Average prices paid by Illinois farmers, December 15, 1977-79 1/

Item and unit	1977	1978	1979
		Dollars	
		FEED	
Soybean meal, 44% protein, 100 lbs.	11.00	12.50	13.00
Laying feed "complete feed" per ton	173.00	180.00	205.00
Chick starter feed, per ton	191.00	205.00	220.00
Dairy feed, 16% protein, per ton	154.00	155.00	175.00
Hog feed, over 29% protein, 100 lbs.	12.50	14.10	14.50
Cattle feed, 30% protein and over, 100 lbs.	9.40	10.30	11.50
		MOTOR SUPPLIES 2/	
Gasoline, filling station, per gal.	.650	3/.700	3/1.070
Diesel fuel, per gal.	.480	.500	.900
Motor oil, all-weather, (high detergent) per gal.	3.60	3.80	4.40
Grease, 35-lb. pail	16.50	19.00	24.50
Tires, auto, each			
Bias-belted, G78-15	44.50	44.50	51.00
Radial, 205-15 GR78-15	73.00	73.00	78.00
Tires, truck, 7.50 x 20, 10-ply, each	92.00	99.00	4/150.00
Tires, tractor, rear, 13.6 x 28, 4-ply, each	150.00	145.00	5/285.00
Storage batteries, CPR 220-310 AMPS	41.50	43.00	55.00
Anti-freeze, permanent, per gal.	4.30	4.10	4.85

1/ Averages at independent and chain stores. 2/ October 15. 3/ Unleaded.
4/ 9.00-20, 10-ply, 1979. 5/ 15.5-38, 6-ply, 1979.

OTHER DATA SERIES

This section contains data series which did not fall under other major category headings. Included in this bulletin are fertilizer information, and farm employment and wage rates.

1/ This fertilizer information was obtained when interviewing farm operators for Objective Yield Surveys conducted by the Economics and Statistics Service and are not official estimates of total fertilizer use. The samples are relatively small and the data are subject to sampling fluctuation. 2/ Percentages apply to acres receiving fertilizer, not to total acres harvested.

COMMODITIES INCLUDED IN THE ILLINOIS FARM REPORT - A BI-WEEKLY REPORT ISSUED ABOUT THE 12TH AND 25TH OF EACH MONTH BY THE ILLINOIS CROP REPORTING SERVICE

Commodity	Approximate date of report	Source of data for estimates
Field Crops:		
Winter wheat seedings	December	Farm operators
Prospective spring plantings	January, April	Farm operators
Harvested acreage forecasts	July	Farm operators
Yield & production forecasts	Monthly during growing season	Farm operators Field measurements 1/
Annual crop summary	January	Farm operators
Stocks of grain((farm and off-farm)	January, April, June, September 2/ October	Farm operators and mills & elevators
Weather - Crop	3 P.M. Monday - April thru November	Local observers
Commercial fertilizer sales	Monthly	Bureau of Products Inspection and Standards' totals of weekly reports filed in accordance with the Illinois Fertilizer Act
Seeds	January, August, October	Farm operators and shippers
Popcorn	January, July	Processors
Fruit:		
Peach production	June, July, August, January	Fruit growers
Apple production	July, August, October, January	Fruit growers
Vegetables:		
Fresh market, acreage and production	April, July, October	Vegetable growers
Processing, acreage and production	March, June, August, September, December	Vegetable processors
Meat Animals:		
Cattle inventory and calf crop	February, August	Farm operators
Sheep inventory	February	Farm operators
Hog inventory and pig report	March, June, September, December	Farm operators
Cattle on feed	January, April, July, October	Farm operators
Sheep and lambs on feed	January	Farm operators
Lamb and wool crop	March, July	Farm operators
Commercial slaughter	Monthly	Livestock slaughter plants
Poultry:		
Chicken inventory	February	Farm operators Hatcheries
Turkey inventory	January	Farm operators Hatcheries
Egg production	Monthly	Farm operators Commercial egg producers
Chicks hatched	Monthly	Hatcheries
Milk:		
Milk production	Monthly	Milk producers
Dairy products manufactured	June	Milk product manufacturers
Honey:		
Number colonies and production honey and beeswax	January	Honey producers
Prices:		
Local market prices of farm products	Monthly	Farm product buyers
Prices paid by farmers for feed	Monthly	Merchants
Timber prices	April, October	Timber buyers
Farm Employment:		
Employment on farms and farm wage rates	February, May, August, November	Farm operators

1/ Counts and measurements from small plots at monthly intervals prior to maturity. Mature grain and soybeans harvested and subjected to detailed laboratory analysis. 2/ Soybeans only.
